PICO: How your voice becomes a sales order

Example: “Add 5 of Product A and 10 of Product B” – where does the AI work, where does classic software work, where does the human decide?

AI (language models) · Classic software & data (rule-based) · Human

1 · Speak

The sales rep speaks or types their request in the browser (Fiori).

Microphone & UI: no AI credentials

2 · Speech → text

Speech recognition turns what was said into text (German & English).

AI: speech recognition
only the “ear” – evaluates nothing, does not answer itself

3 · Detect intent

The AI decides what is wanted – exactly one of six functions. Unclear? It asks.

AI: language understanding
(Routing)

4 · Run the function

Here the AI helps understand:
- Recognize products & quantities (unclear → follow-up question)
- Find customers by name/number

using the real catalog as reference

Here classic software computes:
- Draft from order history
- Product recommendations
- Plausibility check
- Copy last order

5 · Safeguard

Product IDs are checked against the catalog, prices from master data.

No AI:
Numbers come from your data

6 · Decide

The human reviews the draft and clicks **“Create Order”.**

Only then is the order created in SAP Sales Cloud

PICO answers by voice (AI: text → speech)
only reads out the finished text, adds nothing

What the AI does

- ✓ Turn speech into text
- ✓ Understand what is meant
- ✓ Recognize products, quantities, customers
- ✓ Ask friendly follow-up questions
- ✓ Read answers aloud naturally

What classic software does

- ✓ Customers, products, prices from SAP Sales Cloud
- ✓ Drafts & recommendations from history
- ✓ Plausibility check of line items
- ✓ Verify all AI results against master data
- ✓ Login & authorizations (SAP BTP)

What stays with the human

- ✓ Orders are never created automatically
- ✓ AI results only land in the draft
- ✓ Review, change, confirm
- ✓ Exactly one function per command
- ✓ The AI never invents products or prices

🗣 Outlook: fully voice-controllable

The showcase can be extended step by step so that the entire flow – from selecting the customer to the final confirmation – is driven by voice alone.
